

CHALLENGES OUR PLANET IS FACING

The US sends over 140 million tons of waste to landfills each year

At the current rate, landfills will be full by 2035

Food waste in landfills decomposes slowly and produces methane

Methane is a greenhouse gas that contributes to climate change

HOW COMPOSTING CAN HELP

50% of your waste can be composted

Hauling organic scraps is a less expensive disposal option

Composting converts organic scraps into soil through a natural decomposition process

Compost, a nutrient-rich soil amendment, improves the health of our local soils
